Scheduler.....3

Add a New Token for the Alert Report (3.24.4.1).....3

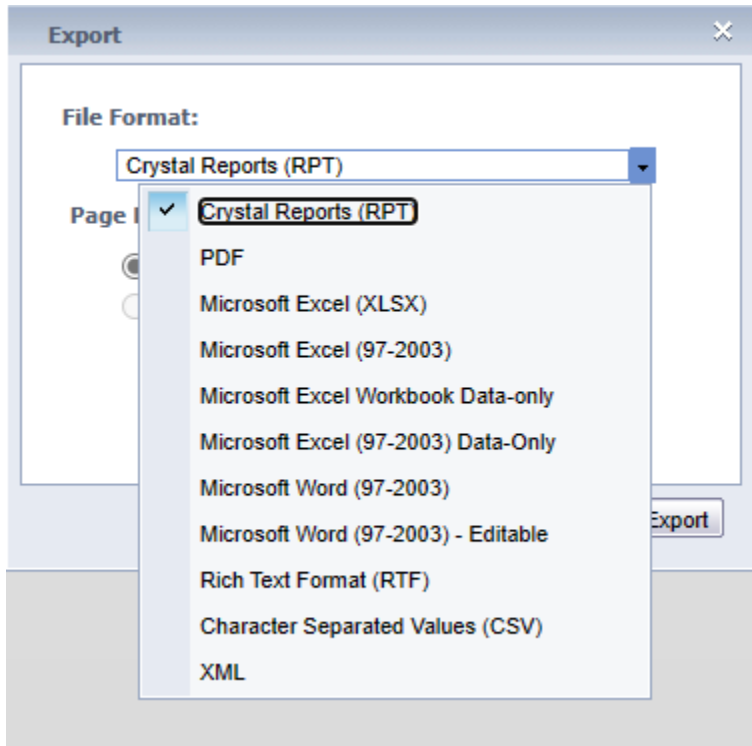

UPDATED THE CODE TO USE THE CRYSTAL REPORTS RUNTIME ENGINE SP31 (3.24.4.1)

The Ripplestone server will need to be updated to Service Pack 31 (SP31) of the Crystal Reports Runtime Engine.

UPDATED THE SCHEDULEFILE.ASPX PAGE TO USE THE SELECTED THEME AND STYLESHEETS

## HOME PAGE

UPDATED THE CODE TO DISPLAY ANY NEW EXPORT FILE TYPES IN THE LIST OF FILES (3.24.4.1)

ADD A NEW TOKEN FOR THE ALERT REPORT (3.24.4.1)

Added new Token that can be used for the Output File Name and for the Email Subject line. The token is called [AlertSelectionValue] and it is used on the Alert Report tab. The token will be substituted with the Select Value in the alert report. This is helpful so the recipient of the email has more information on what the report contains.

DocumentFolder & ParametersOutput File NameExternal ParametersScheduleEmailAlert ReportUnmanaged Output

Use the box below to change the output file name. You can type in any text for the name, but you do not need an extension. You can also use tokens to dynamically change the name.

Output File Name

[FileName].[AlertSelectionValue].[Date:yyyy\_MM\_dd hhmmssff]

Date Offset

Minute0

Use the date offset to add or subtract the date part selected from the date token.

The default name is [FileName].[Date:yyyy\_MM\_dd hhmmssff]

Below are the available tokens that can be used:

[FileName]

This is the report file name without the extension

[JobID]

This is the unique Job ID from the first tab

[JobDescription]

This is the job description from the first tab

[DateTime]

This is the current date and time formatted with the format of yyyy-MM-dd hhmmss

[Date:]

This allows you to determine the format of the date and time using the standard date parts. For example, [Date:yyyy-MM-dd]  
Note: Do not use forward-slash, backslash or colon since they are not valid in file names.

[ParameterX]

This will use the value for the parameter with the "X" being substituted with a number. For example, [Parameter1] will get the value for the first parameter.

[AlertSelectionValue]

This will use the Selection Value from the Alert Report tab. The value from the Alert Report will be substituted for each running of the report.

**Note:** The final name cannot be larger than 255 characters and the file name cannot contain the following special characters: \ / : \* ? < > |
